JMSR on parabens:

"Almost all topical products that contain water must be preserved to prevent microbiological contamination over the period of their shelf life and use. One of the most popular and effective preservative systems is a group of compounds called "parabens" (e.g. methylparaben, ethylparaben). Parabens have a long history of safe and effective use in all dosage forms including injections and ophthalmics. They are approved in all major countries for use in drugs and cosmetics including EU, US and Japan. Yet, in spite of the safety record supported by sound scientific research and decades of safe use, the use of parabens has come under criticism for various reasons because of a few studies that have since been largely discredited. Regardless, unfortunately public perception has been tainted.

JMSR uses a variety of preservatives in its products including parabens. However, being sensitive to its consumer needs, JMSR continues to evaluate other safe and effective paraben-free preservatives that may be used where possible. Many of our past and present formulations are paraben-free."
